

EXECUTIVE BRIEF · TRANSFORMATION PROGRAM DECISION INTELLIGENCE ADVISORY

Independent advisory for boards, executive teams and SI proposal teams.

Lilian Corvington — an independent advisor who introduces Decision Intelligence into transformation programs and binds it to the two workstreams every program already runs: data governance and program control. Not a new platform. A discipline that names, records and improves the decisions the program has to make anyway.

Where the value comes from

Most transformation programs already ship a data governance workstream and a program control workstream. Decision Intelligence is what makes both of them useful to the executive team: it turns governance from a policy document into the way decisions get made, and turns program control from a status report into a record of decisions taken.

What Decision Intelligence is

A practical discipline for making, recording and improving decisions. Frame the decision, model the logic, feed it from governed data, execute with human control points, learn from realised outcomes.

How the advisory ties it in

Data governance becomes the source of truth for decisions. Program control becomes the decision log. AI enters under protocol, not as a shortcut. Safety of the record leads — then efficiency and reuse.

Safety of the record comes first. Then efficiency and reuse. Quantitative outcomes get better along two axes at once — the program executes faster because nothing is rebuilt from scratch, and every artifact is reusable in the next phase and by the next team. Neither is pursued at the expense of the client's decision record. That order does not change.

What the advisory covers

01 The client keeps the record.

Data, decisions and the record stay owned by the business. No parallel workspace, no shadow copy, no vendor system of record. The engagement ends and the record does not leave with it.

02 Human control points are named.

Every decision has an owner, a cadence, an evidence pack and an outcome measure. The steering committee reviews decisions, not slides.

03 AI contributes under protocol.

Models propose options, explain their reasoning, and cite the governed data they used. The named human decides. The record shows who decided, on what evidence, and why.

04 Activate phases run faster because nothing is rebuilt.

SAP Activate is the baseline method; other delivery standards adopt the same way — same record, same approvals, different phase names. Discover > Prepare > Explore > Realize > Deploy > Run.

05 The record is the deliverable.

A durable archive of decisions, evidence, assumptions, dependencies, changes and outcomes — retrievable by authorised AI workflows, portable across teams, and audit-ready by construction.

ENGAGEMENT PROCESS

It starts with a simple meeting.

There is no procurement path to walk down first. The relationship opens with an introductory session — a working conversation, not a pitch — to understand the program in front of the board, the decisions the executive team is having to make, and where Decision Intelligence could help. Every subsequent step is commissioned on evidence, not on speculation.

Step one — Introductory session

A single meeting, typically 45–60 minutes. Held over video or in person. No slides, no NDA required for the conversation itself, no follow-on obligation. The agenda is short: what the transformation program is trying to move, which decisions are proving hardest, where the record currently lives, and what would be useful to look at more closely.

The session produces a short written note of what was discussed and a candid read on whether Decision Intelligence, in this form, is a fit. If it is not, the note says so — clean parting.

Step two — Two ways the advisory is structured

If the introductory session shows fit, the engagement takes one of two shapes. Both are additive to what the client already has and do not compete with existing service delivery partners.

OPTION A**Limited assessment of an existing program**

A time-boxed review of a transformation program already in flight. Two to six weeks. Reads the current decision surface, the data governance posture and the program control cadence, and returns a written assessment with a short list of concrete moves the executive team can make immediately. Priced as a fixed fee against a defined scope; no runtime, no retainer, no lock-in.

Fits when: the program is mid-flight and the executive team wants an independent read on whether the decision record will survive the closing gate.

OPTION B**Inclusion in a proposal with a delivery partner**

The advisory joins a proposal team assembled by an SI, boutique consultancy or headhunter-brokered consortium — adding Decision Intelligence, sovereign data posture and program-control substance to the response without competing with the delivery scope. Positioned as the independent human control-point advisor across the proposed program.

Fits when: a delivery firm is responding to an enterprise transformation RFP and needs credible governance and decision-record substance in the response.

Step three — How the work actually runs

01 The client's tools, the client's rules, the client's record.

Work happens inside the client's existing tenants, systems and approval routes. Nothing is migrated, replaced, or switched off. If the advisory were removed tomorrow, every system, process and approval would stand exactly as it does today.

02 Cadence set to the program, not the calendar.

Working sessions align to the program's own stage gates and steering rhythms. No standing weekly meeting; engagement flexes with what the decisions actually need.

03 Written output that outlasts the engagement.

Every session produces a written note the client keeps: what was discussed, what was decided, what was left open, and what evidence supported it. These notes become the beginning of the decision log.

04 Model processing is optional and separately accounted.

AI model processing, when used, is either insourced (run inside the client's own tenant on the client's own account) or rebilled at cost as an expense against the provider's statement. Never marked up. Never carried inside the hours.

WHY THIS SHAPE

Small footprint, durable substance.

The advisory is deliberately structured to be easy to start, easy to end, and impossible to lock in. That is what makes it useful to the buyers it is built for — boards, executive teams, and SI proposal teams that need substance without adding another vendor to manage.

FOR BOARDS AND EXECUTIVE TEAMS**An independent read on the decision record.**

Executives keep hearing that the transformation program is on track. They want to know whether the decisions being made along the way will survive scrutiny six quarters from now — from an auditor, a regulator, a new CFO, or an AI-enabled review. The advisory answers that question in writing.

FOR SI PROPOSAL TEAMS**Governance substance in the response.**

Enterprise transformation RFPs increasingly ask about decision intelligence, sovereign data posture, and AI safety. A named independent advisor in the proposal — one who does not compete with the delivery scope — makes those sections credible instead of aspirational.

FOR HEADHUNTERS AND OPERATORS**A senior name that travels between programs.**

Available for named executive-advisor placements on enterprise transformation programs across sectors. Sector-agnostic; deepest currency in SAP-anchored transformations, financial services, and regulated industries where the decision record is the deliverable.

What the client keeps when the advisory ends

Whether the engagement is a two-week assessment or a nine-month proposal-team position, the client leaves the engagement with more of their own record than they walked in with. That is the deliverable, and it belongs to them.

A written decision log. Every decision the advisory participated in, with owner, evidence, and outcome measure.

A governance posture on paper. The client's current data governance stance, restated in a form the executive team can hand to an auditor or a new hire.

An AI-safety protocol they authored. Not a vendor template — the client's own rules for how models may participate in decisions inside the business.

A closing note. What was accomplished, what remains open, and how to run this discipline without the advisor. No dependency created.

HOW TO OPEN THE CONVERSATION

Request the introductory session.

One email, three lines: which program, which decision is proving hardest, and a proposed 45-minute window. A written reply follows within two business days with either a session time or a candid note on why the shape is not a fit.
